# Package controller

## Class Summary

### [CloseListener](#)

Shows an "Are you sure?"

### [DifficultyAction](#)

Takes care of showing a New Game-dialog to the user and start a new game based on their difficultychoice.

### [DifficultySelectionAction](#)

Starts a new game based on the user's selection

### [HelpAction](#)

Takes care of finding and showing help to the user.

### [NumberAction](#)

Changes the number on the board based on a user's selection.

### [SudokuApplet](#)

The main initiation point for the Applet-version of our game.

### [SudokuGame](#)

The main initiation point for the Application-version of our game.

---

controller

## Class CloseListener

```
java.lang.Object
|
+--controller.CloseListener
```

### All Implemented Interfaces:

java.awt.event.ActionListener, java.awt.event.WindowListener

---

< [Constructors](#) > < [Methods](#) >

---

```
public class CloseListener
extends java.lang.Object
implements java.awt.event.ActionListener, java.awt.event.WindowListener
```

Shows an "Are you sure?" dialog before exiting.

## Constructors

# CloseListener

```
public CloseListener()
```

## Methods

### actionPerformed

```
public void actionPerformed(java.awt.event.ActionEvent arg0)
```

Checks whether or not the user is sure before closing the window.

---

### windowActivated

```
public void windowActivated(java.awt.event.WindowEvent e)
```

Doesn't need to do anything special.

---

### windowClosed

```
public void windowClosed(java.awt.event.WindowEvent e)
```

Doesn't need to do anything special.

---

### windowClosing

```
public void windowClosing(java.awt.event.WindowEvent e)
```

Checks whether or not the user is sure before closing the window.

---

### windowDeactivated

```
public void windowDeactivated(java.awt.event.WindowEvent e)
```

Doesn't need to do anything special.

---

### windowDeiconified

```
public void windowDeiconified(java.awt.event.WindowEvent e)
```

Doesn't need to do anything special.

---

## windowIconified

```
public void windowIconified(java.awt.event.WindowEvent e)
```

Doesn't need to do anything special.

---

## windowOpened

```
public void windowOpened(java.awt.event.WindowEvent e)
```

Doesn't need to do anything special.

---

controller

# Class DifficultyAction

```
java.lang.Object
|
+-- javax.swing.AbstractAction
|   |
|   +-- controller.DifficultyAction
```

### All Implemented Interfaces:

java.io.Serializable, java.lang.Cloneable, javax.swing.Action

---

< [Constructors](#) > < [Methods](#) >

---

```
public class DifficultyAction
extends javax.swing.AbstractAction
```

Takes care of showing a New Game-dialog to the user and start a new game based on their difficultychoice.

## Constructors

## DifficultyAction

```
public DifficultyAction(MainInterface component,
                       Game game,
                       java.lang.Boolean firstScreen)
```

Creates a DifficultyAction associated with the component and based on the game. The firstScreen-flag determines if there should be an "Are you sure?"-dialog before showing the difficultyselection.

### Parameters:

- component - The MainInterface to associate the action with
- game - The game to reset if the user wants to start a new game
- firstScreen - Enables the "Are you sure"-dialog if firstScreen is false

## Methods

### actionPerformed

```
public void actionPerformed(java.awt.event.ActionEvent e)
```

controller

## Class DifficultySelectionAction

```
java.lang.Object
|
+-- javax.swing.AbstractAction
|
+-- controller.DifficultySelectionAction
```

### All Implemented Interfaces:

java.io.Serializable, java.lang.Cloneable, javax.swing.Action

< [Constructors](#) > < [Methods](#) >

```
public class DifficultySelectionAction
extends javax.swing.AbstractAction
```

Starts a new game based on the user's selection

## Constructors

### DifficultySelectionAction

```
public DifficultySelectionAction(Game game,
                                java.awt.Component frame)
```

## Methods

### actionPerformed

```
public void actionPerformed(java.awt.event.ActionEvent arg0)
```

Starts a new game based on the ActionCommand sent when the user clicked one of the difficultybuttons.

controller

# Class HelpAction

```
java.lang.Object
|
+-- javax.swing.AbstractAction
|
+-- controller.HelpAction
```

## All Implemented Interfaces:

java.io.Serializable, java.lang.Cloneable, javax.swing.Action

---

< [Constructors](#) > < [Methods](#) >

---

```
public class HelpAction
extends javax.swing.AbstractAction
```

Takes care of finding and showing help to the user.

## Constructors

### HelpAction

```
public HelpAction(MainInterface frame,
                  Game game)
```

## Methods

### actionPerformed

```
public void actionPerformed(java.awt.event.ActionEvent e)
```

If there are mistakes on the board, these gets marked. Otherwise it finds a solvable field (if any) and marks it on the board.

---

controller

# Class NumberAction

```
java.lang.Object
|
+-- javax.swing.AbstractAction
|
+-- controller.NumberAction
```

## All Implemented Interfaces:

java.io.Serializable, java.lang.Cloneable, javax.swing.Action

---

< [Constructors](#) > < [Methods](#) >

---

```
public class NumberAction
extends javax.swing.AbstractAction
```

Changes the number on the board based on a user's selection.

## Constructors

### NumberAction

```
public NumberAction(MainInterface main,
                    int fieldId,
                    java.awt.Component frame)
```

## Methods

### actionPerformed

```
public void actionPerformed(java.awt.event.ActionEvent e)
```

Shows a dialog and changes the numbervalue and the sheep's text based on the user's selection.

---

controller

# Class SudokuApplet

```
java.lang.Object
|
+-- java.awt.Component
|   |
|   +-- java.awt.Container
|       |
|       +-- java.awt.Panel
|           |
|           +-- java.applet.Applet
|               |
|               +-- javax.swing.JApplet
|                   |
|                   +-- controller.SudokuApplet
```

## All Implemented Interfaces:

java.awt.MenuContainer, java.awt.image.ImageObserver, java.io.Serializable,  
javax.accessibility.Accessible, javax.swing.RootPaneContainer

---

< [Constructors](#) > < [Methods](#) >

---

```
public class SudokuApplet
extends javax.swing.JApplet
```

The main initiation point for the Applet-version of our game.

## Constructors

### SudokuApplet

```
public SudokuApplet()
```

## Methods

### init

```
public void init()
```

Gets run when the applet gets loaded into the browser.

#### Overrides:

init in class java.applet.Applet

---

controller

# Class SudokuGame

```
java.lang.Object
|
+--controller.SudokuGame
```

---

< [Constructors](#) > < [Methods](#) >

---

```
public class SudokuGame
extends java.lang.Object
```

The main initiation point for the Application-version of our game.

## Constructors

### SudokuGame

```
public SudokuGame()
```

## Methods

### main

```
public static void main(java.lang.String[] args)
```

# Package model

## Interface Summary

### [GameSettings](#)

Interface to retrieve GameSettings

## Class Summary

### [Board](#)

Board.java is able to generate sudoku boards, get values from fields and set values in fields.

### [EasySettings](#)

The easy gamesettings for a 9x9 Sudoku.

### [Game](#)

Contains the gameboard and the solution.

### [General9x9Settings](#)

Contains the general settings for a 9x9 sudoku

### [Generator](#)

The sudoku generator.

### [HardSettings](#)

The hard gamesettings for a 9x9 Sudoku.

### [Helper](#)

Helper.java is able to find a field thats solveable, find fields that are incorrectly filled in and how many mistakes present on the board.

### [NormalSettings](#)

The normal gamesettings for a 9x9 Sudoku.

### [Solver](#)

Solver class used to solve a Sudoku-puzzle.

### [Statistics](#)

The statistics of the current game.

### [SudokuMath](#)

Performs various mathematical operations on SudokuBoards.

---

model

# Class Board

```
java.lang.Object
|
+-- java.util.Observable
|
+-- model.Board
```

---

< [Constructors](#) > < [Methods](#) >

---

```
public class Board
extends java.util.Observable
```

Board.java is able to generate sudoku boards, get values from fields and set values in fields. It can compare two boards to check if the sudoku is solved.

## Constructors

### Board

```
public Board()

    Creates a board with all fields filled in.
```

---

### Board

```
public Board(int[] boardArray)
```

---

### Board

```
public Board(int[] boardArray,
    GameSettings settings)
```

---

### Board

```
public Board(Board board)
```

---

# Board

```
public Board(GameSettings settings)
```

## Methods

### getSettings

```
public GameSettings getSettings()
```

**Returns:**

the settings

---

### getValue

```
public int getValue(int fieldId)  
    throws java.lang.IllegalArgumentException
```

Gets the value from board[] at position a

**Parameters:**

fieldId -

**Returns:**

The value at the fieldId-position.

**Throws:**

java.lang.IllegalArgumentException -

---

### isEqualTo

```
public boolean isEqualTo(Board compareBoard)
```

Compares current board to supplied board to determine if the sudoku is correctly solved.

**Parameters:**

compareBoard - The board to compare to.

**Returns:**

True or false depending on whether or not the boards are equal.

---

### print

```
public void print()
```

---

## reset

```
public void reset(GameSettings settings,  
                  Game game)
```

---

## setValue

```
public void setValue(int fieldId,  
                     int value)  
    throws java.lang.IllegalArgumentException
```

Sets a value b into board[] at position a

**Parameters:**

fieldId - The fieldnumber whose value is to be set  
value - The value to set

**Throws:**

java.lang.IllegalArgumentException -

---

## shuffle

```
public void shuffle()
```

Shuffles rows, columns, quadrantcolumns and quadrantrows of the board.

---

## switchColumns

```
public void switchColumns(int first,  
                           int second)
```

Switches the two supplied columns in the board.

**Parameters:**

first - The first column to be switched.  
second - The second column to be switched.

---

## switchQuadrantColumns

```
public void switchQuadrantColumns(int first,  
                                   int second)
```

Switches the two supplied quadrantcolumns in the board.

**Parameters:**

first - The first quadrantcolumn to be switched.

second - The second quadrantcolumn to be switched.

---

## switchQuadrantRows

```
public void switchQuadrantRows(int first,  
                                 int second)
```

Switches the two supplied quadrantrows in the board.

**Parameters:**

first - The first quadrantrow to be switched.

second - The second quadrantrow to be switched.

---

## switchRows

```
public void switchRows(int first,  
                         int second)
```

Switches the two supplied rows in the board.

**Parameters:**

first - The first row to be switched.

second - The second row to be switched.

---

## toArray

```
public int[] toArray()
```

---

model

# Class EasySettings

```
java.lang.Object
|
+--General9x9Settings
    |
    +--model.EasySettings
```

All Implemented Interfaces:

[GameSettings](#)

---

< [Fields](#) > < [Constructors](#) > < [Methods](#) >

---

```
public class EasySettings
    extends General9x9Settings
    implements GameSettings
```

The easy gamesettings for a 9x9 Sudoku.

## Fields

## IDENTIFIER

```
public static final int IDENTIFIER
```

## Constructors

## EasySettings

```
public EasySettings()
```

## Methods

## getDifficulty

```
public java.lang.String getDifficulty()
```

returns the difficulty

**Returns:**

The difficulty

---

## getNumbersToRemove

```
public int getNumbersToRemove()
```

returns the numbers to remove

### Returns:

The numbers to remove

### Overrides:

[getNumbersToRemove](#) in class [General9x9Settings](#)

---

model

## Class Game

```
java.lang.Object
|
+--model.Game
```

---

< [Constructors](#) > < [Methods](#) >

---

```
public class Game
extends java.lang.Object
```

Contains the gameboard and the solution. When a new game is created Game will create a new board.

## Constructors

### Game

```
public Game()
```

Stores the solved board in solutionBoard. Makes the generator remove numbers until the desired difficulty is reached and then stores the new board in currentBoard

## Methods

### getCurrentBoard

```
public Board getCurrentBoard()
```

returns the current board

### Returns:

The current board

---

## getSolutionBoard

```
public Board getSolutionBoard()
```

returns the solved board

**Returns:**

The solved board

---

## getStatistics

```
public Statistics getStatistics()
```

returns the statistics

**Returns:**

The statistics

---

## reset

```
public void reset(GameSettings settings)
```

creates a new statistics element based on the settings.

**Parameters:**

settings -

---

## setSolutionBoard

```
public void setSolutionBoard(Board solutionBoard)
```

stores the solved board

**Parameters:**

solutionBoard -

---

model

# Interface GameSettings

---

< [Methods](#) >

---

```
public interface GameSettings
```

Interface to retrieve GameSettings

## Methods

### getBoardDimensions

```
public int getBoardDimensions()
```

---

### getBoardLength

```
public int getBoardLength()
```

---

### getDifficulty

```
public java.lang.String getDifficulty()
```

---

### getNumbersToRemove

```
public int getNumbersToRemove()
```

---

### getQuadrantDimensions

```
public int getQuadrantDimensions()
```

---

### getStdBoardArray

```
public int[] getStdBoardArray()
```

---

### getValidValues

```
public int[] getValidValues()
```

---

model

# Class General9x9Settings

```
java.lang.Object
|
+--model.General9x9Settings
```

All Implemented Interfaces:

[GameSettings](#)

Direct Known Subclasses:

[EasySettings](#), [HardSettings](#), [NormalSettings](#)

---

< [Constructors](#) > < [Methods](#) >

---

public abstract class **General9x9Settings**  
extends java.lang.Object  
implements [GameSettings](#)

Contains the general settings for a 9x9 sudoku

## Constructors

### General9x9Settings

```
public General9x9Settings()
```

## Methods

### getBoardDimensions

```
public int getBoardDimensions()
```

returns the board dimension

**Returns:**

The board dimension

---

### getBoardLength

```
public int getBoardLength()
```

returns the board length

**Returns:**

The board length

---

## getNumbersToRemove

```
public abstract int getNumbersToRemove()
```

returns the number of fields to remove

**Returns:**

The number of fields to remove

---

## getQuadrantDimensions

```
public int getQuadrantDimensions()
```

returns the quadrant dimension

**Returns:**

The quadrant dimension

---

## getStdBoardArray

```
public int[] getStdBoardArray()
```

returns the standard board array for the current settings

**Returns:**

The standard board array for the current settings

---

## getValidValues

```
public int[] getValidValues()
```

returns the valid values

**Returns:**

The valid values

---

model

# Class Generator

```
java.lang.Object  
|  
+--model.Generator
```

---

< [Constructors](#) > < [Methods](#) >

---

```
public abstract class Generator
extends java.lang.Object
```

The sudoku generator.

## Constructors

### Generator

```
public Generator()
```

## Methods

### generate

```
public static void generate(Board board)
```

### generate

```
public static void generate(Board board,
GameSettings settings)
```

Generates a playable gameboard removing one field at a time untill the desired difficulty is achieved.

**Parameters:**

board - The board to remove fields from.  
settings - The board settings (board size)

model

## Class HardSettings

```
java.lang.Object
|
+--General9x9Settings
    |
    +--model.HardSettings
```

**All Implemented Interfaces:**

[GameSettings](#)

< [Fields](#) > < [Constructors](#) > < [Methods](#) >

```
public class HardSettings
extends General9x9Settings
```

implements [GameSettings](#)

The hard gamesettings for a 9x9 Sudoku.

## Fields

### IDENTIFIER

```
public static final int IDENTIFIER
```

## Constructors

### HardSettings

```
public HardSettings()
```

## Methods

### getDifficulty

```
public java.lang.String getDifficulty()
```

returns the difficulty

**Returns:**

The difficulty

---

### getNumbersToRemove

```
public int getNumbersToRemove()
```

returns the numbers to remove

**Returns:**

The numbers to remove

**Overrides:**

[getNumbersToRemove](#) in class [General9x9Settings](#)

---

model

# Class Helper

```
java.lang.Object
|
+--model.Helper
```

---

< [Constructors](#) > < [Methods](#) >

---

public abstract class **Helper**  
extends java.lang.Object

Helper.java is able to find a field thats solveable, find fields that are incorrectly filled in and how many mistakes present on the board.

## Constructors

### Helper

```
public Helper()
```

## Methods

### findSolveable

```
public static int findSolveable(Board board,  
                                GameSettings settings)  
    throws java.lang.NoSuchFieldException
```

Finds a field on the current board which is solveable and returns that field id.

**Parameters:**

board - The board from which the help is needed.  
settings - The game settings from which the board is created under.

**Returns:**

A fieldId that is solveable and suggested to the player.

**Throws:**

java.lang.NoSuchFieldException -

---

## findSolveable

```
public static int findSolveable(Game game)  
    throws java.lang.NoSuchFieldException
```

Finds a field on the current board which is solveable and returns that fieldId. Calls findSolveable(game.getCurrentBoard(), game.getCurrentBoard().getSettings());

**Parameters:**

game - The current game.

**Returns:**

A fieldId that is solveable and suggested to the player.

**Throws:**

java.lang.NoSuchFieldException -

---

## getAmountOfMistakes

```
public static int getAmountOfMistakes(Game game)
```

This function scans the board for mistakes and returns how many mistakes there currently is.

**Parameters:**

game - The current game that's being played.

**Returns:**

The number of mistakes currently on the board.

---

## getFieldsWithMistakes

```
public static int[] getFieldsWithMistakes(Game game)
```

Gets an int-array with the fieldIds containing mistakes. Calls getFieldsWithMistakes (game, getAmountOfMistakes(game));

**Parameters:**

game - The current game.

**Returns:**

An int[] containing the fieldIds with mistakes.

---

## getFieldsWithMistakes

```
public static int[] getFieldsWithMistakes(Game game,  
                                         int amountOfMistakes)
```

Gets an int-array with the fieldIds containing mistakes.

### Parameters:

game - The current game.  
amountOfMistakes - Used to the size of the result array.

### Returns:

An int[] containing the fieldIds with mistakes.

---

model

## Class NormalSettings

```
java.lang.Object  
|  
+--General9x9Settings  
|  
+--model.NormalSettings
```

### All Implemented Interfaces:

[GameSettings](#)

---

< [Fields](#) > < [Constructors](#) > < [Methods](#) >

---

```
public class NormalSettings  
extends General9x9Settings  
implements GameSettings
```

The normal gamesettings for a 9x9 Sudoku.

## Fields

## IDENTIFIER

```
public static final int IDENTIFIER
```

## Constructors

## NormalSettings

```
public NormalSettings()
```

## Methods

### getDifficulty

```
public java.lang.String getDifficulty()
```

returns the difficulty

**Returns:**

The difficulty

---

### getNumbersToRemove

```
public int getNumbersToRemove()
```

returns the numbers to remove

**Returns:**

The numbers to remove

**Overrides:**

[getNumbersToRemove](#) in class [General9x9Settings](#)

---

model

## Class Solver

```
java.lang.Object  
|  
+--model.Solver
```

---

< [Constructors](#) > < [Methods](#) >

---

```
public abstract class Solver  
extends java.lang.Object
```

Solver class used to solve a Sudoku-puzzle.

## Constructors

### Solver

```
public Solver()
```

## Methods

## solveField

```
public static int solveField(int fieldNum,  
                             Board board)
```

In calling the solver, first solverLevelOne is used, then if this is unable to produce a unique result, call solverLevelTwo.

### Parameters:

fieldNum - the integer value the specific field has on the board  
board - the sudoku board used

### Returns:

the result of trying to solve the field, 0 if not solveable.

---

model

## Class Statistics

```
java.lang.Object  
|  
+--model.Statistics
```

---

< [Constructors](#) > < [Methods](#) >

---

```
public class Statistics  
extends java.lang.Object
```

The statistics of the current game. Keeps track of the amount of Hints and Mistakes made.

## Constructors

### Statistics

```
public Statistics()
```

Creates a new statistics type for the game. The amount of hints used and mistakes made from start is, naturally, 0.

## Methods

## getElapsedTime

```
public java.lang.String getElapsedTime()
```

returns the time elapsed durring play

### Returns:

The time elapsed durring play

---

## getHints

```
public int getHints()
```

Returns the amount of hints used.

### Returns:

The amount of hints.

---

## getMistakes

```
public int getMistakes()
```

Returns the amount of mistakes used.

### Returns:

The amount of mistakes

---

## increaseHints

```
public void increaseHints()
```

Increases the amount of hints used by 1.

---

## increaseMistakesBy

```
public void increaseMistakesBy(int amount)
```

Increases the amount of mistakes used by 1.

---

## setStopTime

```
public void setStopTime()
```

Sets the time at which the Sudoku was solved.

---

model

# Class SudokuMath

```
java.lang.Object
|
+--model.SudokuMath
```

---

< [Constructors](#) > < [Methods](#) >

---

public abstract class **SudokuMath**  
extends java.lang.Object

Performs various mathematical operations on SudokuBoards. Everything is 0-index'ed, and works on boards of all sizes. Fx. a row from a 3x3x9 Sudoku has the numbers 0 to 8.

## Constructors

### SudokuMath

```
public SudokuMath()
```

## Methods

### getColumnFromPos

```
public static int[] getColumnFromPos(int position,  
                                       Board board)
```

Gets the contents of the column based on the position in the board. This is done by first calculating the columnNumber, adding the value this position contains to an array, and then continuously adding boardDim to the columnNumber, adding that value to the array until the array has boardDimension values in it.

**Parameters:**

position - The position to get the column from.  
board - The board to get the column from.

**Returns:**

An int-array containing the column.

---

## getColumnNumber

```
public static int getColumnNumber(int position,  
                                GameSettings settings)
```

Converts a position to a columnnumber, by calculating (position % boardDimension).

**Parameters:**

position - The position on the board.

**Returns:**

The number of the column.

---

## getQuadrantFromPos

```
public static int[] getQuadrantFromPos(int position,  
                                       Board board)
```

Gets the contents of the quadrant based on the position in the board. It calculates the fieldId of the top left corner of the quadrant, and then adds the fieldIds based on the size of the board.

**Parameters:**

position - The position to get the quadrant from.

board - The board to get the quadrant from.

**Returns:**

An int-array containing the quadrant.

---

## getQuadrantNumber

```
public static int getQuadrantNumber(int position,  
                                    GameSettings settings)
```

Converts a position to a quadrantnumber, by calculating ((rowNumber / quadrantDim) \* quadrantDim + columnNumber / quadrantDim).

**Parameters:**

position - The position on the board.

**Returns:**

The number of the quadrant.

---

## getRowFromPos

```
public static int[] getRowFromPos(int position,  
                                   Board board)
```

Gets the contents of the row based on the position in the board. This is done by subtracting the columnNumber from the position value, and adding values to an int-array until it has reached the length of the boardDimension.

**Parameters:**

position - The position to get the row from.  
board - The board to get the row from.

**Returns:**

An int-array containing the row.

---

## getRowNumber

```
public static int getRowNumber(int position,  
                                GameSettings settings)
```

Converts a position to a rownumber, by calculating (position / boardDimension).

**Parameters:**

position - The position on the board.

**Returns:**

The number of the row.

# Package tests

## Class Summary

### [TestFindSolveable](#)

The JUnit TestCase Class for Helper.findSolveable().

### [TestSudokuMathGetFromPos](#)

The JUnit TestCase Class for the getXFromPos methods used in SudokuMath.

### [TestSudokuMathGetNumber](#)

The JUnit TestCase Class for the getXNumber methods used in SudokuMath.

---

tests

## Class TestFindSolveable

```
java.lang.Object
|
+-- junit.framework.Assert
|   |
|   +-- junit.framework.TestCase
|       |
|       +-- tests.TestFindSolveable
```

### All Implemented Interfaces:

junit.framework.Test

---

< [Constructors](#) > < [Methods](#) >

---

```
public class TestFindSolveable
extends junit.framework.TestCase
```

The JUnit TestCase Class for Helper.findSolveable().

## Constructors

### TestFindSolveable

```
public TestFindSolveable()
```

## Methods

## testFindSolveable01

```
public void testFindSolveable01()
```

First test of findSolveable(): Tests that the Helper returns an NoSuchFieldException when no solveable fieldId can be found.

---

## testFindSolveable02

```
public void testFindSolveable02()
```

Second test of findSolveable(): This test looks at the opposite of testFindSolveable01, namely when there is a field that can be solved, and that the correct fieldId is returned, plus no Exception is thrown.

---

tests

# Class TestSudokuMathGetFromPos

```
java.lang.Object
|
+-- junit.framework.Assert
|   |
|   +-- junit.framework.TestCase
|       |
|       +-- tests.TestSudokuMathGetFromPos
```

**All Implemented Interfaces:**

junit.framework.Test

---

< [Constructors](#) > < [Methods](#) >

---

```
public class TestSudokuMathGetFromPos
extends junit.framework.TestCase
```

The JUnit TestCase Class for the getXFromPos methods used in SudokuMath.

## Constructors

## TestSudokuMathGetFromPos

```
public TestSudokuMathGetFromPos()
```

## Methods

## testGetColumnFromPos

```
public void testGetColumnFromPos()
```

This tests the second of the getFromPos-methods: getColumnFromPos().

---

## testGetQuadrantFromPos

```
public void testGetQuadrantFromPos()
```

This tests the third of the getFromPos-methods: getQuadrantFromPos().

---

## testGetRowFromPos

```
public void testGetRowFromPos()
```

This tests the first of the getFromPos-methods: getRowFromPos().

---

tests

# Class TestSudokuMathGetNumber

```
java.lang.Object
|
+-- junit.framework.Assert
|   |
|   +-- junit.framework.TestCase
|       |
|       +-- tests.TestSudokuMathGetNumber
```

**All Implemented Interfaces:**

junit.framework.Test

---

< [Constructors](#) > < [Methods](#) >

---

```
public class TestSudokuMathGetNumber
extends junit.framework.TestCase
```

The JUnit TestCase Class for the getXNumber methods used in SudokuMath.

## Constructors

## TestSudokuMathGetNumber

```
public TestSudokuMathGetNumber()
```

## Methods

### testGetColumnNumber

```
public void testGetColumnNumber()
```

This tests the second of the get-methods: getColumnNumber().

---

### testGetQuadrantNumber

```
public void testGetQuadrantNumber()
```

This tests the third of the get-methods: getQuadrantNumber().

---

### testGetRowNumber

```
public void testGetRowNumber()
```

This tests the first of the get-methods: getRowNumber().

# Package view

## Interface Summary

### [MainInterface](#)

Interface for the two different kinds of windows our program contains.

## Class Summary

### [Background](#)

Handles the drawing of the backgroundimage.

### [Board](#)

The graphical representation of our Sudokuboard.

### [CongratulationScreen](#)

A congratulationscreen used to congratulate the user when they have completed a Sudokupuzzle.

### [DifficultySelection](#)

A screen used to let the user select between the different difficulties.

### [Header](#)

The headerimage (the "title").

### [IngameControls](#)

The ingamecontrols (Help- and New Game-button)

### [MainApplet](#)

Our program in Applet-form.

### [MainWindow](#)

### [NumberDialog](#)

### [PlaceCenter](#)

Class containing a function to center a component.

### [SheepSpeak](#)

The SheepSpeak, which is our main method to communicate with the users.

### [Statistics](#)

### [SudokuButton](#)

Creates buttons based on images.

### [SudokuMenu](#)

A menubar containing the proper menuitems.

### [ViewSettings](#)

Abstract class containing the various settings used in the GUI.

---

view

# Class Background

```
java.lang.Object
|
+-- java.awt.Component
|   |
|   +-- java.awt.Container
|       |
|       +-- javax.swing.JComponent
|           |
|           +-- javax.swing.JPanel
|               |
|               +-- view.Background
```

## All Implemented Interfaces:

java.awt.MenuContainer, java.awt.image.ImageObserver, java.io.Serializable,  
javax.accessibility.Accessible

---

< [Constructors](#) > < [Methods](#) >

---

```
public class Background
extends javax.swing.JPanel
```

Handles the drawing of the backgroundimage.

## Constructors

### Background

```
public Background(java.lang.String imageFile)
```

Creates a new backgroundimage from the supplied image.

#### Parameters:

imageFile - The image to load

### Background

```
public Background(java.lang.String imageFile,
                  java.awt.Dimension dim)
```

Creates a new backgroundimage from the supplied image with the specified dimension.

#### Parameters:

imageFile - The image to load

dim - The dimension of the image

## Methods

### paint

```
public void paint(java.awt.Graphics g)
```

Overrides the extended JPanel's paint-method so the image actually gets drawn.

**Overrides:**

paint in class javax.swing.JComponent

---

view

## Class Board

```
java.lang.Object
|
+-- java.awt.Component
|   |
|   +-- java.awt.Container
|       |
|       +-- javax.swing.JComponent
|           |
|           +-- javax.swing.JPanel
|               |
|               +-- view.Board
```

**All Implemented Interfaces:**

java.awt.MenuContainer, java.awt.image.ImageObserver, java.io.Serializable, java.util.Observer, javax.accessibility.Accessible

---

< [Constructors](#) > < [Methods](#) >

---

```
public class Board
extends javax.swing.JPanel
implements java.util.Observer
```

The graphical representation of our Sudokuboard.

## Constructors

### Board

```
public Board(MainInterface main)
```

Creates a new Board where the dimensions are extracted from the MainInterface-object.

**Parameters:**

main - The object containing the board to base the view on.

---

# Board

```
public Board(MainInterface main,  
            java.awt.Dimension dimension)
```

Creates a new Board with a specified dimension.

**Parameters:**

main - The object containing the board to base the view on.  
dimension - The dimension the board should get.

## Methods

### clearHintNotices

```
public void clearHintNotices()
```

Removes all hintnotices from the board.

---

### clearNotice

```
public void clearNotice(int fieldId)
```

Removes a single notice from the board.

**Parameters:**

fieldId - The Id of the field whose backgroundcolor should be reset.

---

### clearNotices

```
public void clearNotices()
```

Removes all colornotices from the board.

---

### getViewBoardDimensions

```
public java.awt.Dimension getViewBoardDimensions()
```

Calculates the visual width of the current gameboard.

**Returns:**

The width of the board.

---

## getViewBoardDimensions

```
public static java.awt.Dimension getViewBoardDimensions(Board board)
```

Calculates the visual width of the supplied gameboard.

**Parameters:**

board - The board to calculate the width of

**Returns:**

The width of the board.

---

## setNotice

```
public void setNotice(int fieldId,  
                      java.awt.Color color)
```

Sets a single notice on the board.

**Parameters:**

fieldId - The Id of the field whose backgroundcolor should be set.

color - The color the field should get.

---

## setNotices

```
public void setNotices(int[] fieldIds,  
                      java.awt.Color color)
```

Set notices on multiple fields.

**Parameters:**

fieldIds - An int-array containing the fieldIds of all the field who should have their backgroundcolor set.

color - The color to set.

---

## setValue

```
public void setValue(int fieldId,  
                    int value)
```

Change the value of a button / field.

**Parameters:**

fieldId - The fieldId of the button / field whose value should be changed.

value - The value to change to.

---

## update

```
public void update(java.util.Observable arg0,  
                  java.lang.Object arg1)
```

When a new game gets created, this updates the board with the new values

---

### view

## Class CongratulationScreen

```
java.lang.Object  
|  
+--view.CongratulationScreen
```

---

< [Constructors](#) > < [Methods](#) >

---

```
public class CongratulationScreen  
extends java.lang.Object
```

A congratulationscreen used to congratulate the user when they have completed a Sudokupuzzle. Also shows the statistics.

## Constructors

### CongratulationScreen

```
public CongratulationScreen()
```

## Methods

### show

```
public void show(MainInterface frame,  
                Game game)
```

Shows a congratulationscreen

**Parameters:**

frame - The MainInterface to show the congratulationscreen on  
game - The game to get the statistics from

---

view

# Class DifficultySelection

```
java.lang.Object
|
+--view.DifficultySelection
```

---

< [Constructors](#) > < [Methods](#) >

---

```
public class DifficultySelection
extends java.lang.Object
```

A screen used to let the user select between the different difficulties.

## Constructors

### DifficultySelection

```
public DifficultySelection(Game game)
```

## Methods

### show

```
public void show(MainInterface frame)
```

Shows the screen.

**Parameters:**

frame - The frame to show the screen on.

---

view

# Class Header

```
java.lang.Object
|
+-- java.awt.Component
|   |
|   +-- java.awt.Container
|       |
|       +-- javax.swing.JComponent
|           |
|           +-- javax.swing.JPanel
|               |
|               +-- view.Header
```

## All Implemented Interfaces:

java.awt.MenuContainer, java.awt.image.ImageObserver, java.io.Serializable,  
javax.accessibility.Accessible

---

< [Constructors](#) > < [Methods](#) >

---

```
public class Header
extends javax.swing.JPanel
```

The headerimage (the "title").

## Constructors

### Header

```
public Header()
```

Creates the header based on the headerimage.

## Methods

### paint

```
public void paint(java.awt.Graphics g)
```

Overrides the paint-method to make sure that the image actually gets painted.

#### Overrides:

paint in class javax.swing.JComponent

---

view

# Class IngameControls

```
java.lang.Object
|
+-- java.awt.Component
|   |
|   +-- java.awt.Container
|       |
|       +-- javax.swing.JComponent
|           |
|           +-- javax.swing.JPanel
|               |
|               +-- view.IngameControls
```

## All Implemented Interfaces:

java.awt.MenuContainer, java.awt.image.ImageObserver, java.io.Serializable,  
javax.accessibility.Accessible

---

< [Constructors](#) > < [Methods](#) >

---

public class **IngameControls**  
extends javax.swing.JPanel

The ingamecontrols (Help- and New Game-button)

## Constructors

### IngameControls

```
public IngameControls(java.awt.Component frame,  
                      DifficultyAction difficultyAction,  
                      HelpAction helpAction)
```

Creates the controls.

#### Parameters:

frame - The frame the screen should be added to.  
difficultyAction - The DifficultyAction showing the New Game-screen.  
helpAction - The HelpAction handling requests for help.

## Methods

### getDifficultyAction

```
public DifficultyAction getDifficultyAction()
```

Gets the DifficultyAction associated with the controls.

#### Returns:

The DifficultyAction

---

## getHelpAction

public [HelpAction](#) getHelpAction()

Gets the HelpAction associated with the controls.

**Returns:**

The HelpAction

---

view

## Class MainApplet

```
java.lang.Object
|
+-- java.awt.Component
|   |
|   +-- java.awt.Container
|       |
|       +-- java.awt.Panel
|           |
|           +-- java.applet.Applet
|               |
|               +-- javax.swing.JApplet
|                   |
|                   +-- view.MainApplet
```

**All Implemented Interfaces:**

java.awt.MenuContainer, java.awt.image.ImageObserver, java.io.Serializable,  
javax.accessibility.Accessible, javax.swing.RootPaneContainer, [MainInterface](#)

---

< [Constructors](#) > < [Methods](#) >

---

```
public class MainApplet
extends javax.swing.JApplet
implements MainInterface
```

Our program in Applet-form.

## Constructors

### MainApplet

```
public MainApplet()
```

## Methods

## add

```
public java.awt.Component add(java.awt.Component component,  
                               int zindex,  
                               int x,  
                               int y)
```

Adds a component to the window.

**Parameters:**

component - The component to add.

zindex - The Z-Index of the position.

x - The X-coordinate.

y - The Y-coordinate.

**Returns:**

The added component.

---

## createBackgroundPanel

```
public void createBackgroundPanel(java.lang.String backgroundImage)
```

Creates a new background with the supplied image.

**Parameters:**

backgroundImage - The image to use as a background.

---

## createBoard

```
public void createBoard()
```

Creates a new board. `setGame()` must have been called before.

---

## createHeader

```
public void createHeader()
```

---

## createIngameControls

```
public void createIngameControls(DifficultyAction difficultyAction,  
                                  HelpAction helpAction)
```

Creates the ingamecontrols.

**Parameters:**

difficultyAction - The action to perform when the "New game" button is pressed.

helpAction - The action to perform when the "Help" button is pressed.

---

## createSheepSpeak

```
public void createSheepSpeak()
```

Create the SheepSpeak-object.

---

## getBackgroundPanel

```
public Background getBackgroundPanel()
```

Gets the background.

**Returns:**

The background.

---

## getBoard

```
public Board getBoard()
```

Gets the graphical representation of the board.

**Returns:**

The board.

---

## getBoardDimension

```
public java.awt.Dimension getBoardDimension()
```

Gets the current dimensions of the board.

**Returns:**

The dimensions of the board.

---

## getControls

```
public IngameControls getControls()
```

---

## getGame

```
public Game getGame()
```

Gets the current instance of the game used.

**Returns:**

The game.

---

## getSheepSpeak

```
public SheepSpeak getSheepSpeak()
```

Gets the current SheepSpeak - the box in which the wise words of the sheep are.

**Returns:**

The SheepSpeak-object.

---

## hideElements

```
public void hideElements()
```

---

## setGame

```
public void setGame(Game game)
```

Sets the current game instance. Must be called before createBoard().

**Parameters:**

game - The game to set.

---

## setMenu

```
public void setMenu()
```

---

## setup

```
public void setup()
```

Performs some standard operations on the window.

---

## showElements

```
public void showElements()
```

---

view

## Interface MainInterface

---

< [Methods](#) >

---

```
public interface MainInterface
```

Interface for the two different kinds of windows our program contains.

## Methods

### add

```
public java.awt.Component add(java.awt.Component component,
                              int zindex,
                              int x,
                              int y)
```

Adds a component to the window.

**Parameters:**

component - The component to add.  
zindex - The Z-Index of the position.  
x - The X-coordinate.  
y - The Y-coordinate.

**Returns:**

The added component.

---

## createBackgroundPanel

```
public void createBackgroundPanel(java.lang.String backgroundImage)
```

Creates a new background with the supplied image.

**Parameters:**

backgroundImage - The image to use as a background.

---

## createBoard

```
public void createBoard()
```

Creates a new board. `setGame()` must have been called before.

---

## createHeader

```
public void createHeader()
```

Creates and adds the header to the frame.

---

## createIngameControls

```
public void createIngameControls(DifficultyAction difficultyAction,  
                                HelpAction helpAction)
```

Creates the ingamecontrols.

**Parameters:**

`difficultyAction` - The action to perform when the "New game" button is pressed.  
`helpAction` - The action to perform when the "Help" button is pressed.

---

## createSheepSpeak

```
public void createSheepSpeak()
```

Creates and adds the SheepSpeak-object.

---

## getBackgroundPanel

```
public Background getBackgroundPanel()
```

Gets the background contained in the frame.

**Returns:**

The background.

---

## getBoard

```
public Board getBoard()
```

Gets the graphical representation of the board.

**Returns:**

The board.

---

## getBoardDimension

```
public java.awt.Dimension getBoardDimension()
```

Gets the current dimensions of the board.

**Returns:**

The dimensions of the board.

---

## getControls

```
public IngameControls getControls()
```

Gets the IngameControls contained in the frame.

**Returns:**

The IngameControls

---

## getGame

```
public Game getGame()
```

Gets the current instance of the game used.

**Returns:**

The game.

---

## getSheepSpeak

```
public SheepSpeak getSheepSpeak()
```

Gets the current SheepSpeak - the box in which the wise words of the sheep are.

**Returns:**

The SheepSpeak-object.

---

## hideElements

```
public void hideElements()
```

Hides all interfaceelements.

---

## setGame

```
public void setGame(Game game)
```

Sets the current game instance. Must be called before createBoard().

**Parameters:**

game - The game to set.

---

## setGlassPane

```
public void setGlassPane(java.awt.Component glassPane)
```

Set the glasspane of the frame to the specified glasspane.

**Parameters:**

glassPane - The glassPane to set as glasspane.

---

## setMenu

```
public void setMenu()
```

Creates and adds the menu to the frame.

---

## setup

```
public void setup()
```

Performs some standard operations on the window.

---

## showElements

```
public void showElements()
```

Shows all interfaceelements.

---

view

# Class MainWindow

```
java.lang.Object
|
+-- java.awt.Component
|   |
|   +-- java.awt.Container
|       |
|       +-- java.awt.Window
|           |
|           +-- java.awt.Frame
|               |
|               +-- javax.swing.JFrame
|                   |
|                   +-- view.MainWindow
```

## All Implemented Interfaces:

java.awt.MenuContainer, java.awt.image.ImageObserver, java.io.Serializable,  
javax.accessibility.Accessible, javax.swing.RootPaneContainer, javax.swing.WindowConstants,  
[MainInterface](#)

---

< [Constructors](#) > < [Methods](#) >

---

```
public class MainWindow
extends javax.swing.JFrame
implements MainInterface
```

## Author:

Julian

## Constructors

## MainWindow

```
public MainWindow()
```

## Methods

## add

```
public java.awt.Component add(java.awt.Component component,  
                               int zIndex,  
                               int x,  
                               int y)
```

Adds a component to the window.

**Parameters:**

component - The component to add.

zindex - The Z-Index of the position.

x - The X-coordinate.

y - The Y-coordinate.

**Returns:**

The added component.

---

## createBackgroundPanel

```
public void createBackgroundPanel(java.lang.String backgroundImage)
```

Creates a new background with the supplied image.

**Parameters:**

backgroundImage - The image to use as a background.

---

## createBoard

```
public void createBoard()
```

Creates a new board. `setGame()` must have been called before.

---

## createHeader

```
public void createHeader()
```

---

## createIngameControls

```
public void createIngameControls(DifficultyAction difficultyAction,  
                                  HelpAction helpAction)
```

Creates the ingamecontrols.

**Parameters:**

difficultyAction - The action to perform when the "New game" button is pressed.

helpAction - The action to perform when the "Help" button is pressed.

---

## createSheepSpeak

```
public void createSheepSpeak()
```

Create the SheepSpeak-object.

---

## getBackgroundPanel

```
public Background getBackgroundPanel()
```

Gets the background.

**Returns:**

The background.

---

## getBoard

```
public Board getBoard()
```

Gets the graphical representation of the board.

**Returns:**

The board.

---

## getBoardDimension

```
public java.awt.Dimension getBoardDimension()
```

Gets the current dimensions of the board.

**Returns:**

The dimensions of the board.

---

## getControls

```
public IngameControls getControls()
```

---

## getGame

```
public Game getGame()
```

Gets the current instance of the game used.

**Returns:**

The game.

---

## getSheepSpeak

```
public SheepSpeak getSheepSpeak()
```

Gets the current SheepSpeak - the box in which the wise words of the sheep are.

**Returns:**

The SheepSpeak-object.

---

## hideElements

```
public void hideElements()
```

---

## setGame

```
public void setGame(Game game)
```

Sets the current game instance. Must be called before createBoard().

**Parameters:**

game - The game to set.

---

## setMenu

```
public void setMenu()
```

---

## setup

```
public void setup()
```

Performs some standard operations on the window.

---

# showElements

```
public void showElements()
```

|           |
|           +--java.awt.Dialog
|               |
|               +--javax.swing.JDialog
|                   |
|                   +--view.NumberDialog
```

### All Implemented Interfaces:

java.awt.MenuContainer, java.awt.image.ImageObserver, java.io.Serializable,  
javax.accessibility.Accessible, javax.swing.RootPaneContainer, javax.swing.WindowConstants

---

< [Constructors](#) > < [Methods](#) >

---

```
public class NumberDialog
extends javax.swing.JDialog
```

**Author:**  
Julian

## Constructors

### NumberDialog

```
public NumberDialog(MainInterface main)
```

Creates a numberdialog with using the settings of the supplied MainInterface and also using it as parent.

#### Parameters:

main -

## Methods

## getValue

```
public int getValue()
```

---

view

# Class PlaceCenter

```
java.lang.Object
|
+--view.PlaceCenter
```

---

< [Constructors](#) > < [Methods](#) >

---

```
public abstract class PlaceCenter
extends java.lang.Object
```

Class containing a function to center a component.

## Constructors

### PlaceCenter

```
public PlaceCenter()
```

## Methods

### placeCenter

```
public static void placeCenter(java.awt.Component component)
```

Places the component on the center of the screen.

**Parameters:**

component - The component to center.

---

view

# Class SheepSpeak

```
java.lang.Object
|
+-- java.awt.Component
|   |
|   +-- java.awt.Container
|       |
|       +-- javax.swing.JComponent
|           |
|           +-- javax.swing.JPanel
|               |
|               +-- view.SheepSpeak
```

## All Implemented Interfaces:

java.awt.MenuContainer, java.awt.image.ImageObserver, java.io.Serializable,  
javax.accessibility.Accessible

---

< [Constructors](#) > < [Methods](#) >

---

```
public class SheepSpeak
extends javax.swing.JPanel
```

The SheepSpeak, which is our main method to communicate with the users.

## Constructors

### SheepSpeak

```
public SheepSpeak()
```

## Methods

### paint

```
public void paint(java.awt.Graphics g)
```

#### Overrides:

paint in class javax.swing.JComponent

---

### resetText

```
public void resetText()
```

---

# setText

```
public void setText(java.lang.String text)
```

view

## Class Statistics

**All Implemented Interfaces:**  
java.awt.MenuContainer, java.awt.image.ImageObserver, java.io.Serializable,  
javax.accessibility.Accessible

< [Constructors](#) >

```
public class Statistics
extends javax.swing.JPanel
```

**Author:**  
Julian

## Constructors

### Statistics

```
public Statistics(Game game)
```

Creates the statisticspanel based on the supplied game.

**Parameters:**  
game - The game to base the statistics on.

view

# Class SudokuButton

```
java.lang.Object
|
+-- java.awt.Component
|   |
|   +-- java.awt.Container
|       |
|       +-- javax.swing.JComponent
|           |
|           +-- javax.swing.AbstractButton
|               |
|               +-- javax.swing.JButton
|                   |
|                   +-- view.SudokuButton
```

## All Implemented Interfaces:

java.awt.ItemSelectable, java.awt.MenuContainer, java.awt.image.ImageObserver,  
java.io.Serializable, javax.accessibility.Accessible, javax.swing.SwingConstants

---

< [Constructors](#) > < [Methods](#) >

---

```
public class SudokuButton
extends javax.swing.JButton
```

Creates buttons based on images.

## Constructors

### SudokuButton

```
public SudokuButton(java.lang.String imageFile)
```

Creates a button based on the supplied image.

#### Parameters:

imageFile - The image to use as a background.

## Methods

### paint

```
public void paint(java.awt.Graphics g)
```

Overrides the paint-method to make sure that the image gets drawn.

#### Overrides:

paint in class javax.swing.JComponent

---

view

# Class SudokuMenu

```
java.lang.Object
|
+-- java.awt.Component
|   |
|   +-- java.awt.Container
|       |
|       +-- javax.swing.JComponent
|           |
|           +-- javax.swing.JMenuBar
|               |
|               +-- view.SudokuMenu
```

## All Implemented Interfaces:

java.awt.MenuContainer, java.awt.image.ImageObserver, java.io.Serializable,  
javax.accessibility.Accessible, javax.swing.MenuElement

---

< [Constructors](#) >

---

```
public class SudokuMenu
extends javax.swing.JMenuBar
```

A menubar containing the proper menuitems.

## Constructors

### SudokuMenu

```
public SudokuMenu(MainInterface main)
```

Create the menubar and add it to the supplied MainInterface

#### Parameters:

main - The MainInterface which should get the menubar.

---

view

# Class ViewSettings

```
java.lang.Object
|
+-- view.ViewSettings
```

---

< [Constructors](#) > < [Methods](#) >

---

```
public abstract class ViewSettings
extends java.lang.Object
```

Abstract class containing the various settings used in the GUI.

## Constructors

### ViewSettings

```
public ViewSettings()
```

## Methods

### getAlternateHeight

```
public static int getAlternateHeight()
```

**Returns:**

The alternate height used for the congratulationscreen and difficultyselection.

---

### getBoardSpacing

```
public static int getBoardSpacing()
```

**Returns:**

The spacing between the quadrants on the board.

---

### getButtonBackground

```
public static java.awt.Color getButtonBackground()
```

**Returns:**

The backgroundcolor of the buttons

---

### getButtonDimension

```
public static java.awt.Dimension getButtonDimension()
```

**Returns:**

The size of the buttons as a Dimension.

---

## getButtonSize

```
public static int getButtonSize()
```

### Returns:

The size of the buttons on the board.

---

## getHintColor

```
public static java.awt.Color getHintColor()
```

### Returns:

The color used for showing hints on the board.

---

## getMainHeight

```
public static int getMainHeight()
```

### Returns:

The height of the mainwindow.

---

## getMainWidth

```
public static int getMainWidth()
```

### Returns:

The width of the mainwindow.

---

## getWrongNumberColor

```
public static java.awt.Color getWrongNumberColor()
```

### Returns:

The color used for wrong numbers on the board.
